# 1 Production Process

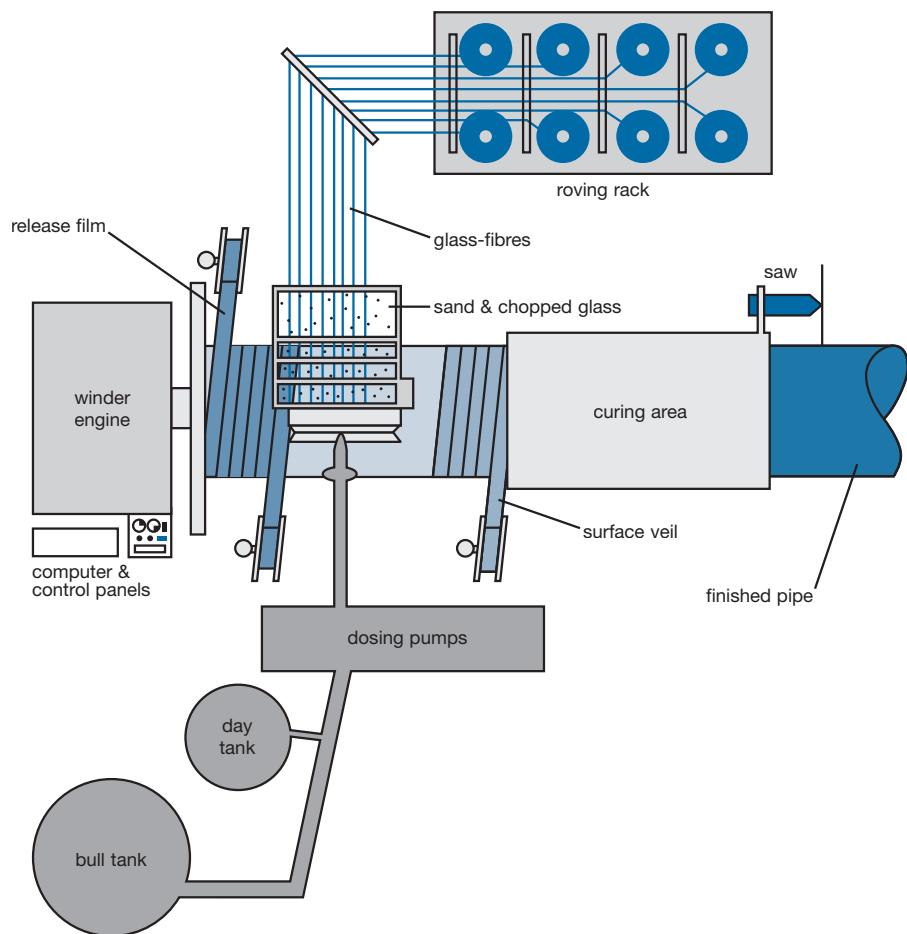

The basic raw materials used in the FLOWTITE pipe's manufacturing are resin, fibreglass and silica sand. Usually unsaturated polyester resins are used since they give good performance for pressure sewer applications.

FLOWTITE pipes are manufactured using the continuous advancing mandrel process, which represents the state of the art in GRP pipe production. This process allows the use of continuous glass fibre reinforcements in the circumferential direction. For a pressure pipe or buried conduit, the principle stress is in the circumferential direction, thus incorporating continuous reinforcements in this direction yields a higher performing product at a lower cost. Using technology developed by material specialists, a very dense laminate is created that maximizes the contribution from three basic raw materials. Both continuous glass fibre rovings and chopable roving are incorporated for high hoop strength and axial reinforcement. A sand fortifier is used to provide increased stiffness by adding extra thickness, placed near the neutral axis in the core. With the FLOWTITE dual resin delivery system, the equipment has the capability of applying a special inner resin liner for severe corrosive applications while utilising a less costly resin for the structural and outer portion of the laminate.

Taking advantage of the winding process, other materials, such as a glass veil or polyester veil can be used to enhance the abrasion resistance and the finishing of the pipe.

The figure above shows a typical cross section of a pipe laminate. This section, as well as the way of applying and placing different raw materials, can differ depending on the pipe application.

# 2 Product Advantages

02

03

04

05

06

07

08

FLOWTITE Technology has been able to bring a product to the market that can provide a low cost, long-term piping solution to customers around the world. The long list of features and benefits add up to provide the optimum installed and life cycle cost system.

## Features & Benefits

### Corrosion-resistant

- Long, effective service-life materials
- No need for linings, coatings, cathodic protection, wraps or other forms of corrosion protection
- Low maintenance costs
- Hydraulic characteristics essentially constant over time

### Light weight

(1/4 weight of ductile iron; 1/10 weight of steel)

- Low transport costs (nestable)
- Eliminates need for expensive pipe handling equipment

### Short and long standard lengths

(up to 18 metres with individual lengths on request)

- Fewer joints reduce installation time
- More pipe per transport vehicle means lower delivery costs

### Extremely smooth bore

- Low friction loss means lower operating costs
- Minimum slime build-up can help lower cleaning costs

### Precision FLOWTITE

with elastomeric gaskets

- Tight, efficient joints designed for coupling to eliminate infiltration and ex-filtration
- Ease of joining, reducing installation time
- Accommodates small changes in line direction without fittings or differential settlement

### Flexible manufacturing

- Custom diameters can be process manufactured to provide maximum flow volumes with ease of installation for rehabilitation lining projects

### High technology pipe design

- Lower wave celerity than other piping materials can mean less cost when designing for surge and water hammer pressures

### High technology pipe manufacturing system

- High and consistent product quality worldwide which produces pipe ensures a reliable product that complies to stringent performance standards (AWWA, ASTM, DIN, EN, etc.)

- Quick and easy installation with construction site equipment due to light weight
- Fast installation with a reduced number of couplings due to pipe lengths up to 18 m
- simple and inexpensive tightness tests
- long usage with consistently high flow rates
- minimal effort for repairs and maintenance
- excellent corrosion resistance
- reinforced inner surface with a high resistance against abrasion

Due to these factors, projects made with FLOWTITE pipe systems are very economical and long-lasting with low maintenance efforts over the years.

## 3 Certificates and Approvals

FLOWTITE pipe systems have been tested and approved for the conveyance of pressure sewer lines meeting many of the world's leading authorities' and testing institutes' criteria, including:

- SABS South African bureau of standards
- Kitemark – UK
- Bureau of Indian standards
- AENOR Asociacionpanole de normalizacion y certificacion – Spain
- COBRTI INSTAL – Poland
- IRAM – Instituto de Racionalización de Materiales – Argentina
- Kiwa – Komo product certificate K22463/03 – The Netherlands
- BCCA Belgian Construction Certification Association BENOR BB 652-665 – Belgium
- ON Österreichisches Normungsinstitut ON-N 2005 085 - Austria
- IGH Certifikat sukladnosti br. 23-070/06 – Croatia
- Institut pro Testování a certifikaci, A.S.01 0187 V/AO/a – Czech Republic
- Igmat Certifikat kontrole proizvodnje VOL2P-CPD-0067 – Slovenia
- CSTB Centre Scientifique et Technique du Bâtiment CSTBat-1/01-AS-136 FLOWTITE G – France
- Centralny Osrodek Badawczo - Rozwojowy Techniki Instalacyjnej AT/2002-02-1285-03 – Poland
- Deutsches Institut für Bautechnik (DIBt) Z-42.1-317 – Germany

FLOWTITE pipe systems fulfil the product standards AWWA, ASTM, DIN, ISO and EN. Other local approvals are also available, dependent on country specific requirements. Amiantit is participating in the development of all these standards with representatives of all the worldwide organisations, thereby ensuring performance requirements will result in reliable products.

# 4 Quality Characteristics

02

03

04

05

06

07

08

## 4.1 Raw Materials

Raw materials are delivered with vendor certification demonstrating their compliance with Flowtite quality requirements. In addition, all raw materials are sample tested prior to their use. These tests ensure that the pipe materials comply with the specifications as stated. Raw materials should be, according to Flowtite quality requirements, pre-qualified in such a way that their suitability to be used in the process and in the final product is demonstrated.

### Raw Materials used in pipe production are:

- Glass
- Resin
- Catalyst
- Sand
- Additives

Only FLOWTITE approved raw materials can be used for the production of the FLOWTITE pipe.

### Glass

Glass is specified by tex which is = weight in grams/1000 meters length  
Hoop roving: Continuous roving used in different tex for the production of the FLOWTITE pipe  
Chop roving cut directly on the machine to provide strength in different directions.

### Resin

Only qualified resin for the winding process. Usually it is delivered in drums or bulk. The resin is prepared in day tanks at the winder. Normal application temperature is 25°C. Resin is delivered from the producer and may be diluted before use on the winder with styrene to reach the required and acceptable viscosity, as defined by FLOWTITE Technology.

### Catalyst

The right amount of catalyst is added to the resin for curing the mix right before application on the mandrel. Only approved catalysts are used in the manufacturing process of the FLOWTITE pipes.

### Sand

Sand is added to the core of the pipe and the inner layer of couplings. High silica sand must be within the FLOWTITE specifications for approved raw material.

### Additives

Additives are used as accelerator for the resin and are mixed with it in the day tanks. The additives are available in different concentration and may be diluted by the producers in mineral spirit to reach the required concentration needed for the production of the FLOWTITE pipes.

## 4.2 Physical Properties

The manufactured pipe's hoop and axial load capacities are verified on a routine basis. In addition, pipe stiffness and deflection tests are carried out in accordance with our internal Flowtite quality regulations.

## 4.3 Finished Pipe Properties

100% of all finished pipes for pressure sewer lines are checked for the following:

- Visual inspection
  - Barcol hardness
  - Wall thickness
  - Section length
  - Diameter
  - Hydrostatic leak tightness test to twice rated pressure (PN6 and above)
- !** **Note:** Pressure and diameters are limited by the hydrotest capacity

## 4.4 Other Quality Characteristics

More detailed information about many other quality characteristics such as:

- Hydrostatic Design Basis – HDB
- Long-term Ring Bending
- Hydro-testing
- Surge and Water Hammer
- Load Capacity Values
- Hoop Tensile Load Capacity
- Axial Tensile Load Capacity
- Flow Velocity
- UV Resistance
- Poisson's Ratio
- Flow Coefficients
- Abrasion Resistance

can be found in our brochure "Technical Characteristics" of FLOWTITE pipes.

# 5 Product Range

FLOWTITE pipe systems are supplied in nominal diameters ranging from DN 80 up to DN 4000 mm. The nominal diameter is considered as the inside diameter. The **standard** diameter range in mm is defined as below:

100 · 150 · 200 · 250 · 300 · 350 · 400 · 450 · 500 · 600 · 700 · 800 · 900 · 1000
1100 · 1200 · 1400 · 1600 · 1800 · 2000 · 2200 · 2400 · 2600 · 2800 · 3000

The locally manufactured standard diameter range varies according to manufacturing facilities. For detailed information, please do not hesitate to contact your on-site contact. Larger diameters than DN 3000 up to 4000 mm and other diameters are available on request.

## 5.1 Stiffness Classes

FLOWTITE pipe systems show the following specific initial stiffness ( $EI/D^3$ ) expressed in N/m<sup>2</sup> and the FLOWTITE standard is defined as follows:

Stiffness Class SN	Stiffness (N/m <sup>2</sup> )
5000	5000
10000	10000

**Table 5-1 Stiffness Class**

Other stiffness classes are available on request. We also supply custom-designed pipe systems with a stiffness tailored to the needs of the project.

## 5.2 Pressure

Our FLOWTITE pipe systems for pressure sewer applications are supplied in the standard pressure classes as listed below:

Pressure Class PN	Pressure Rating Bar	Upper diameter limit
6	6	3000
10	10	2400

**Table 5-2 Pressure Class**

Custom-designed pipes with pressure tailored to the needs of the project are also available.

## 5.3 Length

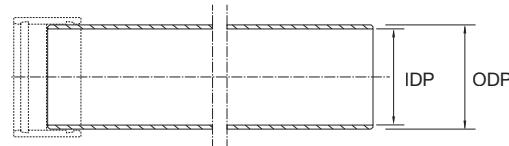

Our FLOWTITE Pipes for pressure sewer are available in standard length of 3, 6 and 12 m. Other tailor-made lengths are available on request.

## 5.4 Hydro-testing

Maximum Factory Test Pressure 2.0 x PN (Pressure Class). Maximum Field Test Pressure 1.5 x PN (Pressure Class). Pressure and diameter upper limit are functions of the hydrotest capacity in the plants.

## 5.5 Standard Pipe and Coupling Data Sheet

Our Flowtite pipe systems for pressure sewer applications are supplied in the standard diameter range, pressure and stiffness classes as listed below. Other diameters and pressure classes are available on request.

**Table 5-6 Large Diameters – Data & Weight – Double Bell Coupling (FPC) data**

# 6 Pipe Joining

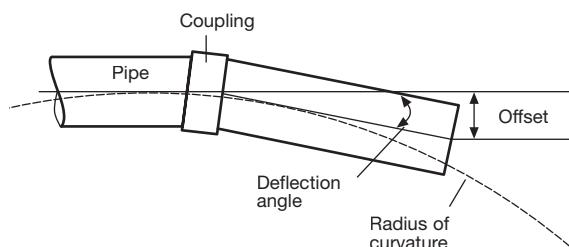

## 6.1 Double Bell Coupling (FPC)

FLOWTITE pipe sections are typically joined using FLOWTITE pressure couplings (FPC). Pipe and couplings may be supplied separately, or the pipe may be supplied with a coupling installed on one end. The FLOWTITE coupling utilises an elastomeric gasket for sealing. The gasket sits in a precision-machined groove in each end of the coupling and seats and seals against a spigot surface.

**!** **Note:** Detailed installation instructions can be found in our separate publications for pipe installation.

### Joint Angular Deflection

The joint is extensively tested and qualified in accordance with ASTM D4161, ISO DIS8639 and EN 1119. Maximum angular deflection (turn) at each coupling joint, measured as the change in adjacent pipe centre lines, must not exceed the amounts given in table below.

The pipes must be joined in a straight alignment, but not all the way to the home line, and thereafter deflected angularly as required (**Figure 6-1**).

Nom Pipe Diameter (mm)	Angular deflection (degrees)
DN ≤ 500	3.0
15 < DN ≤ 800	2.0
900 < DN ≤ 1800	1.0
DN > 1800	0.5

**Table 6-1 Angular Deflection at Double Coupling Joint**

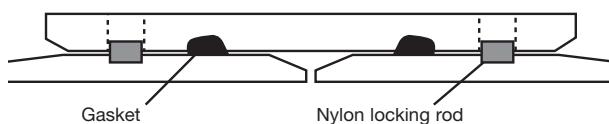

Angle of Deflection (deg)	Maximum Offset (mm) Pipe length			Radius of Curvature (m) Pipe length		
	3 m	6 m	12 m	3 m	6 m	12 m
3.0	157	314	628	57	115	229
2.5	136	261	523	69	137	275
2.0	105	209	419	86	172	344
1.5	78	157	313	114	228	456
1.3	65	120	240	132	265	529
1.0	52	105	209	172	344	688
0.8	39	78	156	215	430	860
0.5	26	52	104	344	688	1376

**Table 6-2 Offset and Radius of Curvature**

## 6.2 Locked Joints

The FLOWTITE locked joint is a double bell with rubber gaskets and locking rods to transfer axial thrust from one pipe section to another. On each side, the coupling bell has a standard rubber gasket and a rod-groove system, through which the load is transferred via compressive and shear action. The pipe spigot for locked joints has a matching groove.

**Figure 6-2 Locked Joint**

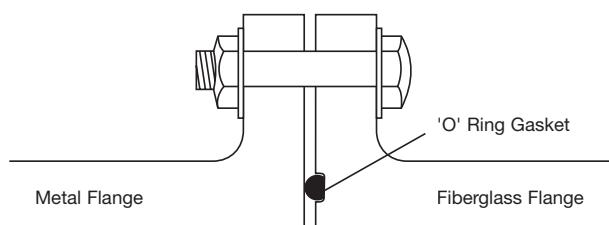

The joint is assembled by using a similar procedure as the standard FLOWTITE coupling, except that there is no centre register.

## 6.3 Other Joining Systems

### GRP Flanges

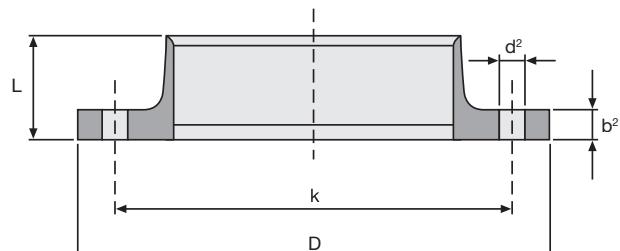

The standard bolt pattern to which our flanges are manufactured is in accordance with ISO2084. Other bolting dimension systems such as AWWA, ANSI, DIN and JIS can also be supplied. Available are flange connections with fibreglass adhesives, as well as zinc steel loose-type flanges. Fibreglass tight flanges and loose-type flanges made of fibreglass can be delivered to order. Loose and fixed flanges are available for all pressure classes.

Contact moulded Flanged joints:

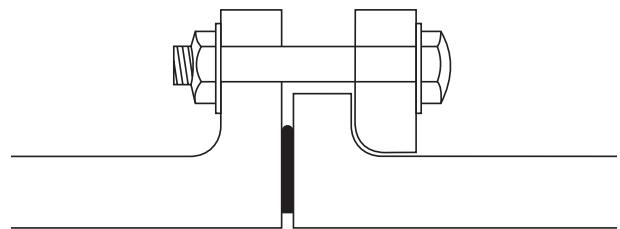

**Figure 6-3 Flanged joint**

Fixed Flange joints:

**Figure 6-4 Fixed Flanged joint**

Loose Ring Flanges:

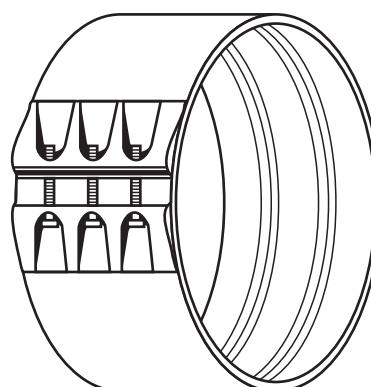

**Figure 6-5 Loose Ring with flat gasket incl. steel support**

### Mechanical Steel Couplings

When connecting FLOWTITE pipe to other materials with different outside diameters, flexible steel couplings are one of the preferred jointing methods. These couplings consist of a steel mantle with an interior rubber sealing sleeve. They may also be used to join FLOWTITE pipe sections together, for example in a repair or for closure. Three grades are commonly available:

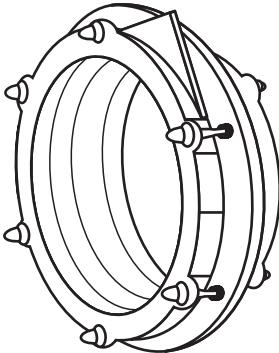

- Coated steel mantle
- Stainless steel mantle
- Hot dip galvanized steel mantle

**Figure 6-6 Flexible steel coupling**

Mechanical couplings have been used to join pipes of different materials and diameters, and to adapt to flange outlets. FLOWTITE Technology has found a wide manufacturing variance in these couplings, including bolt size, number of bolts and gasket design which makes standardized recommendations impossible. If a mechanical joint is used to join FLOWTITE to another pipe material then a dual independent bolting system allows for the independent tightening of the FLOWTITE side which typically requires less torque than recommended by the coupling manufacturer.

Consequently, we cannot recommend the general use of mechanical couplings with FLOWTITE pipe. If the installer intends to use a specific design (brand and model) of mechanical coupling, he is advised to consult with the local FLOWTITE pipe supplier prior to its purchase. The pipe supplier can then advise under what specific conditions, if any, this design might be suitable for use with FLOWTITE.

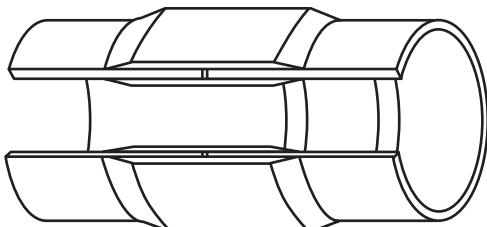

**Figure 6-7 Dual bolt mechanical coupling**

#### Laminated Joints (Butt strap)

Laminated Joints are typically where the transmission of axial forces from internal pressure is required, or as a repair method. The length and thickness of the lay-up depends on diameter and pressure.

Detailed information about the local availability of joints and joining systems can be requested from your local supplier, or is attached to this brochure.

## 7 Accessories

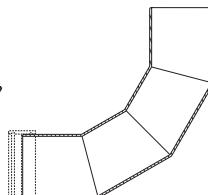

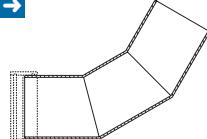

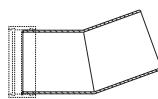

FLOWTITE Technology has created a standardised line of GRP fittings that are moulded or fabricated using the same materials that are used to produce FLOWTITE pressure sewer pipe. One of the benefits of this pipe system is the ability to fabricate a wide assortment of fittings, standard as well as non-standard.

The standard delivery of our fittings include the coupling pre-mounted at one/two ends. Additionally we are able to supply complete spools with pre-installed flange connections. The manufacturing of our accessories follows internationally well accepted ISO standards.

**By ordering fittings in dimensions above DN 1600 it has to be checked if the requested fittings can be transported or if it has to be delivered in parts and assembled on site!**

## 7.8 Fix Flanges – Type A

The standard bolting pattern to which our flanges are manufactured is ISO 2084. Other bolting dimension systems such as AWWA, ANSI, DIN, JIS can be supplied.

The table refers to fix flanges up to pressure class PN 10.

**Pressure Classes PN 6 & PN 10**

Most pressure pipelines periodically have in-line valves for isolating a portion of the supply or distribution system, air and vacuum relief valves at high points in the pipeline to slowly release accumulated air thereby avoiding blockages or to allow air to enter in order to avoid under pressure, and clean out (wash out) or drainage chambers. All of these different appurtenances can be accommodated with FLOWTITE valve chambers. The ultimate responsibility for the design of the piping systems is the professional engineer. However over the years FLOWTITE Technology engineers have observed many different methods of incorporation these appurtenances into a pipeline using FLOWTITE pipe.

Below are some examples, detailed information is available in the "Installation Guide for Buried Pipes".

This handbook is intended as a guide only. All values listed in the product specifications are nominal. Unsatisfactory product results may occur due to environmental fluctuations, variations in operating procedures, or interpolation of data. We highly recommend that any personnel using this data have specialised training and experience in the application of these products and their normal installation and operating conditions.

The engineering staff should always be consulted before any of these products are installed to ensure the suitability of the products for their intended purpose and applications. We hereby state that we do not accept any liability, and will not be held liable, for any losses or damage which may result from the installation or use of any products listed in this handbook as we have not determined the degree of care required for product installation or service. We reserve the right to revise this data, as necessary, without notice. We welcome comments regarding this handbook.
